

Adaptiva OneSite

Overview

Systems management across large global networks is complex and requires significant investments in infrastructure. Adaptiva OneSite™ extends the functionality of Microsoft System Center Configuration Manager for greater efficiencies in IT management. Adaptiva OneSite enables you to manage a large distributed network as if it were just a single local network.

- Easily and quickly achieve complete control and visibility of systems management.
- No system design or operational maintenance.
- Deliver package downloads faster and more efficiently.
- Ensure secure software distribution and patching.
- Lower costs while maximizing bandwidth utilization.
- No costly additional hardware required. Roll-out ConfigMgr server infrastructure instantly.

Features & Benefits

- **Simplified Single Server Network Topology.** Eliminate the entire ConfigMgr hierarchy of hundreds or thousands of sites, servers and distribution points to a **single SCCM site with one server**. Imagine no more proxy management points, secondary sites, child primary sites and distribution points. ConfigMgr functionality is distributed throughout the peer network.
- **Optimize WAN Bandwidth.** Conventional schedule- or throughput-based bandwidth throttles restrain the use of WAN bandwidth. Adaptiva OneSite maximizes the use of WAN bandwidth to achieve nearly 100% network utilization with no impact to other traffic.
- **Flexible Peer-to-Peer Management.** Adaptiva OneSite adapts to your changing environment. OneSite reconfigures itself as the network changes, leading to a fluid infrastructure that is not tethered to specific topological characteristics.
- **Detailed Reporting.** Adaptiva OneSite offers comprehensive reporting with just a click.
